GE Sensing & Inspection Technologies

Sentinel LNG

Panametrics Ultrasonic Flowmeter for Cryogenic Liquids

Benefits

- Improved performance, reduced maintenance and dynamic flow measurement is now available for cryogenic liquids.
- Fully welded construction with no moving parts.
- Ultrasonic transducers protected from cryogenic temperatures using Bundled Wave Technology
- Full bore design, zero pressure drop
- High accuracy to overcome limitations of tank level gauging
- Completely optimised ultrasonic path configuration by extensive use of CFD (Computational Fluid Dynamics)

Applications

- Liquefied Natural Gas (LNG)
- Cryogenic Fluid allocation
- Custody transfer
- Marine Cargo Verification

Cryogenic Flow Measurement from GE

GE introduces Sentinel LNG, a new addition to our series of advanced ultrasonic flowmeters. Sentinel LNG demonstrates new levels of performance, reacts to changes in flow rate with incredible speed and accuracy, and is based on proven technologies. Sentinel LNG extends the use of ultrasonic technology into cryogenic applications for measuring liquefied natural gas (LNG) with unbeatable performance, reliability and safety.

Sentinel LNG Design

The design philosophy behind Sentinel LNG was simple; building an absolute reliable flow meter to overcome the accuracy limitation of LNG tank level measurement. Sentinel LNG is an ultrasonic flowmeter with a fully welded construction that has no moving parts whatsoever. The acoustic transducers are placed outside the cryogenic liquid to avoid any long-term degradation due to temperature. The design is full bore; as a result the pressure drop over the meter is simply equal to a section of pipe with the same length.

Advanced Electronics

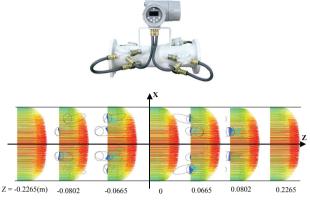

Sentinel LNG measures flow using advanced digitalsignal processing and improved algorithms that enable the meter to measure flow with an exceptional response speed.

Sentinel LNG packs significant power in a simple package available with several standard output options. Customer wiring is kept in a separate location for safety. It can be mounted on the flowcell section or can be mounted up to 50 ft (15 m) away. Full access to cable connections is still possible even when mounted directly to a wall.

Full diagnostic capability can be checked locally on the display, remotely by PC or outputted via a variety of digital interfaces for continuous verification and preventative maintenance.

The Ultimate in Ultrasonic Path Configuration

Before Sentinel LNG was ever tested on a calibration loop, the meter was already extensively tested in the virtual world. Computational Fluid Dynamics (CFD) was used to simulate different path configurations under different flow scenarios. To give an idea of the level of detail we went into, the CFD was done with the same set-up that GE Aviation uses to model the flow in aircraft engines. CFD allowed us to test different ultrasonic path configurations under highly turbulent flow regimes that are typically seen in LNG measurements. Only after CFD simulation provided the optimal path configuration Sentinel LNG was tested in a calibration loop to prove the CFD results.

CFD Simulation of Acoustic Port Effects Under Highly Turbulent Flow

Limitations of Tank Level Gauging

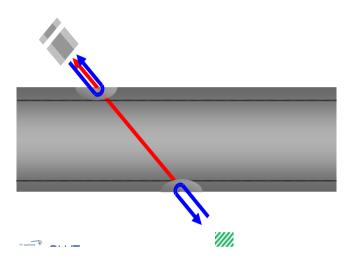

Measuring the volume of LNG in a tank is more then just measuring the level of the (boiling) LNG inside the tank. The temperature in the tank might not be constant causing density variation. Corrections need to be made for tank expansion caused by the weight of the LNG inside. In case of level measurement on a ship, a pitch or even movement because of wave motion may need to be compensated for. By making a direct volume measurement, Sentinel LNG overcomes all these additional sources of uncertainty.

Bundle Waveguide Technology TM

The Bundle Waveguide Technology acts as a buffer rod between the transducer and the flowing cryogenic liquid. These buffer assemblies use waveguide bundles to efficiently concentrate a greater amount of transducer ultrasonic signal into the process. At the same time the bundles act as a buffer to protect the transducer from the cryogenic temperatures. The buffer is an all metal construction with no moving parts. As a results transducers can be safely removed from service without opening the pipeline. An insertion mechanism or expensive valves are not required.

Pulse Echo

Ultrasonic flowmeters use transit time to determine the liquid or gas flow in a pipeline. Measured transit time does however not only consists of the time the ultrasonic signal spends in a fluid, it also consists of a portion 'dead time', being the time that the electrical signal is converted into an acoustical signal and the time the acoustic signal travels inside the transducer. To allow for the utmost accuracy, Sentinel LNG uses pulse echo to actively measure the 'dead time'. By sending a pulse and measuring it's reflection at the end of the transducer, the dead time is measured in real time rather then using a preset value. As a result of this GE invention, Sentinel LNG guarantees a flow measurement of the highest accuracy.

Active Flow Compensation™

Fluctuations in temperature, especially in cryogenic applications, can affect flow accuracy. These fluctuations change the characteristics of the fluid traveling through the pipe, flowcell dimensions and the acoustic characteristics of the flowmeter. Based on a life temperature input, Sentinel LNG monitors the application temperature and calculates the changes in the flowcell dimensions. The transducer's transit-time signal changes relative to temperature. Sentinel LNG's SEN898 electronics actively measure the transducer transit-time signal to ensure accurate overall transit time measurement. The meter automatically and continuously makes adjustments as the application and ambient conditions change to ensure accurate measurement without user intervention.

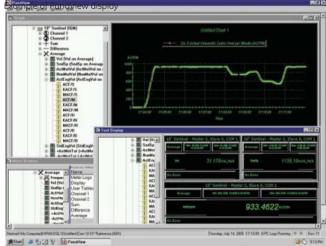

Advanced Electronics

Sentinel LNG has an advanced digital signal processors that pack significant power in a simple package. Several output options are standard. The electronics can be mounted on the flowcell section or up to 50 feet away. Cable connections can easily be accessed, even when the meter has been mounted to a wall. HART is standard on all meters; local diagnostics can be done via magnetic contacts through the glass, or by using the USB connection and our Panaview software.

Panaview for Diagnostics

Panaview software facilitates communication between a PC and the Sentinel LNG flowmeter. This software monitors your Sentinel flowmeter to provide a secure and comprehensive check on the meter configuration with a full audit trail. It also allows live flow readings and tracking of flow diagnostics.

Specifications

Performance

Fluid Types Liquid hydrocarbons

Flow Measurement Correlation Transit Time mode

Accuracy $<\pm\,0.25\%$ of measured volume for flow rates between 3 and 30 ft/s

Zero Stability < 0.007 ft/s

Process Temperature - 200° to +120°C

Ambient Temperature - 40° to +60°C

Storage Temperature - 40° to +80 C

Meter Body

Path Configuration 4 path Gaussian Quadrature

Meter Body Materials Stainless steel A182, Gr 304/304L Stainless steel A182, Gr 316/316L Others on request

Pipe Sizes 4" (100 mm) to 36" (900 mm) Others on request

Flange Ratings 150 # 300 # Others on request

Pipe Schedules

10S 40S Others on request

PED Compliance System complies with 73/23/EEC LVD PED Cat III, module H

Installation Requirement

Meter must be installed with 20D straight piping upstream and 5D straight piping downstream. Inlet and outlet piping ID must meet meter ID.

Pressure, temperature and density connections must be located in the downstream piping. The 20D upstream piping must be free of any nozzles that could disturb the flow profile.

Electronics

Electronics Enclosure Material Epoxy coated aluminium

Dimensions Weight 25 lb (11,5 kg) Size (lxhxd): 13 x11x 9" (33x27x23 cm)

Environmental Protection USA: Type 4

Europe: IP66

Power Supply 100 - 240 VAC

12 - 32 VDC

Power Consumption

< 20 Watt

Display High contrast 128 × 64 pixel graphical display with LED illumination.

Outputs

Two frequency/pulse outputs optically insulated from DC Two alarm relays One 4/20 mA output with HART

Inputs

Two 4/20 mA and one 100 Ohm RTD input for density, pressure and temperature input (option) Three 4/20 mA inputs for density, pressure and temperature input (option)

Digital Interfaces

HART over 4/20 mA output PanaLink over RS232/485/USB Modbus over RS232/485 (option)

Flow Computer Functionality

Integrated flow computer with full P and T volume corrections according to API 11.1

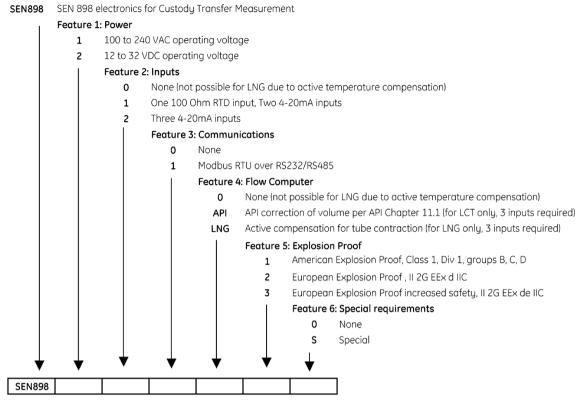

Hazardous Area Classification

USA: Class 1, Div 1, groups B, C,&D Europe: ATEX II 2D EEx d IIC (EEx de as option)

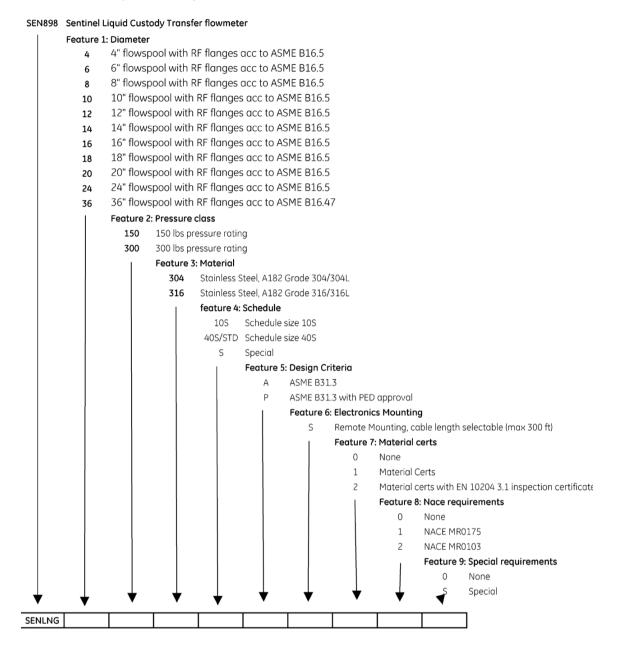

EMC Compliance

73/23/EEC LVD
